

FAUNAWOOD – WOOD MODIFIED WITH WOOD, A CIRCULAR ALTERNATIVE TO CREOSOTE

Faunawood uses European pine-wood impregnated with a special bio-based resin. The result is a durable, strong wood pole, perfect for various applications. The impregnation ensures the product is not damaged by wood rotting fungi and termites for at least 25 years. During production the poles are processed (debarked and pointed) to the end application, thereby making FaunaWood easy to install and use.

DID YOU KNOW?

New wood preservatives are in high demand as companies look for sustainable alternatives to creosote. Studies have shown that Faunawood contributes 82% less greenhouse gas emissions compared to fossil-based creosotes, and due to its lower toxicity is also 7.4 times less damaging to human health. Old wood poles can be reused to produce the modification resin – making Faunawood a truly circular product.
